

ADOLESCENT SEXUAL AND REPRODUCTIVE HEALTH IN BOMET COUNTY

Introduction

Bomet County has a youthful population with people below age 15 making up 46% of the total population (Figure 1). This is mainly because many more children are added to the population than the number of people dying.

This youthful population has implications on the County's health and development agenda as it puts increasing demands on provision of services including health and education. One of the main areas of concern in Kenya is the sexual and reproductive health (SRH) of adolescents and the extent to which their SRH needs are met. One in four (25%) people in Bomet County are adolescents aged 10-19.

This fact sheet highlights the status of adolescent SRH in Bomet County in relation to the national trend. The data are drawn from the 2014 Kenya Demographic and Health Survey, 2012 Kenya AIDS Indicator Survey and the 2014 Basic Education Statistical Booklet.

Policy and legal context

Kenya has favourable policy and legal frameworks that promote adolescent SRH and SRH rights. These frameworks include the Constitution (2010), National Adolescent Sexual and Reproductive Health Policy (2015), National Guidelines for Provision of Adolescent Youth Friendly Services (YFS) in Kenya (2005), the Children Act (2001) and the National Youth Policy (2007).

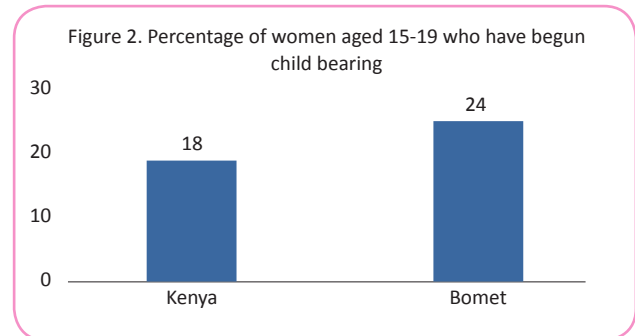

Adolescent SRH Indicators

Age of sexual debut and first marriage

- Half of both Bomet County women (20-49 years old) and men (20-54 years old) first had sex by age 17. At national level, women and men in the same age groups first had sex at age 18 and 17, respectively.
- Half of Bomet County women (25-49 years old) and men (30-54 years old) first married by age 19 and 25, respectively. At the national level, women and men in the same age groups first married by age 20 and 25, respectively.

Teen pregnancy

- About one in four (24%) girls aged 15-19 years in Bomet County have begun childbearing, which is higher than the national rate (Figure 2). Specifically, 4.5% are pregnant with their first child and 19.6% have ever given birth compared to 3.4% and 14.7%, respectively, at the national level.
- Bomet County's age specific fertility rate for girls aged 15-19 (adolescent birth rate) is 130 births per 1000 girls, which is notably higher than the national rate (96).

Contraceptive use among adolescents

- Teenage pregnancies often result from low use of contraceptives and/or unmet need for contraceptives. In Bomet County, one in five (20%) currently married girls aged 15-19 use modern contraceptives which is lower compared to the national rate (37%) (Figure 3).
- Unmet need for contraceptives among currently married adolescents in Bomet is notably high. About half (51%) of currently married girls aged 15-19 would like to avoid pregnancy but are not using a modern contraceptive method, compared to 23% at the national level.

Figure 3. Current use of modern contraceptives and unmet need for contraceptives among women aged 15-19 (%)

HIV prevalence and prevention among adolescents

- County level HIV data are not yet available. At regional level, 2% of youth aged 15-24 in the former Rift Valley South, where Bomet County is located, have HIV. This is similar to the national youth HIV prevalence rate, but considerably higher than in other regions including Rift Valley South (0.5%).
- One of the most effective ways of preventing Sexually Transmitted Infections and HIV is through correct and consistent use of condoms during sex.
- In the former Rift Valley province, where Bomet County is located, a considerable proportion of young people practice safe sex but a considerable proportion also engage in risky sex. In 2014, 52% of never married young women aged 15-24 used a condom during their last sexual encounter. Whereas, 68% of never married young men aged 15-24 used a condom during their last sexual encounter.
- This means that between 30 and 50% of never married young people in the region did not use a condom during their last sexual encounter.

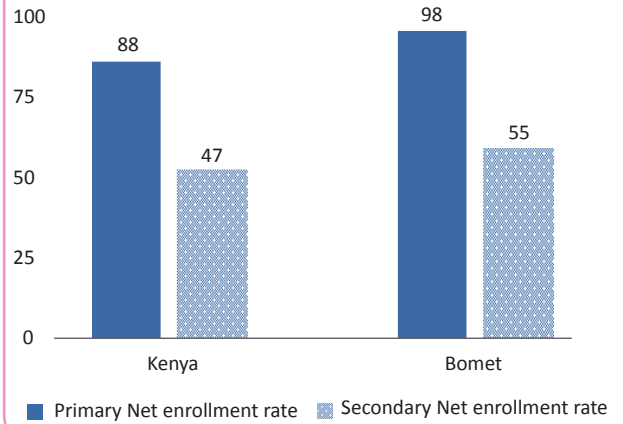

Other important indicators

Education outcomes

- Education is an important determinant for sexual and reproductive health particularly among girls. Girls who complete secondary and higher education have better sexual and reproductive health outcomes – they are less likely to have unwanted pregnancies and more likely to have higher socio-economic status.
- Bomet County is doing well on primary school enrollment compared to the national average. Majority (98%) of children in the official primary school-age are enrolled in primary school (Net enrollment rate).

- However, just over half (55%) of children in the official secondary school-age are enrolled in secondary school.
- At national level, 88% of children in the official primary school-age are enrolled in primary school and less than half (47%) of children in the official secondary school-age are enrolled in secondary school (Figure 4).

Female circumcision among adolescents

- Female circumcision, commonly referred to as Female Genital Mutilation or Cutting is linked to obstetric complications and gynecological problems, and long-term negative effects on women’s wellbeing.
- It is also often linked to girl child marriage which also has long-term negative effects on women’s health and wellbeing.
- Only 4% girls aged 15-19 in Bomet County reported that they have been circumcised compared to 12% at the national level (Figure 5).
